Code Challenge 8

1. Assume you want to build two functions for discounting products on a website. Function number 1 is for student discount which discounts the current price to 10%. Function number 2 is for additional discount for regular buyers which discounts an additional 5% on the current student discounted price. Depending on the situation, we want to be able to apply both the discounts on the products. Design the above two mentioned functions and apply them both simultaneously on the price.
